How can we serve you?

Group 1

Chair: Eva Thörn
Rapporteur: Audrey Didier
Policies and regulations

- Development of two procedures
  - Simplified MTA for direct use or private use of genetic resource
    Uniformisation between genebanks?
  - Standard MTA for breeding, research or training
    Uniformisation in the use of SMTA is requested

- All material in Annex 1 or not have to be treated in the same way

- How deal with gene patent?
  Genebank have to take a patent or publish each results within a consortium?
Nature of services (1)

- More collaborating way have to be developed for characterisation
  - Tools are available (Eurisco)
  - Time and money still needed to develop the tools and the interest of GR holder
Nature of services (2)

- Who are the user? And what they want?
  - 2 levels of working
    - Accession: landrace
      - Markers analysis not so useful as information is based on one individual of a population = way to conserve?
    - Sample: access to genotype
      - Perfect area to develop collaboration between breeders and scientist for sequencing data
  - Feed-back information from users is needed to better defined services genebank can provide
    - A platform is needed to better understand what the user want to maximizing the effort
Material on offer

Genetic stocks require:

Specific skills to maintain

Special capacity building is needed to conserve and grow such material

Long term conservation by research team are not certain

An international effort to deal with these material is highly needed - International consortium?
Service through collaboration

Genebanks have to be proactive

Reach special agreement before sending the seed to include an obligation of feed-back by the requester.
